**Experiment / assignment / tutorial
No. 4**

Grade: AA / AB / BB / BC / CC / CD / DD

Experiment No.:4

TITLE: Building and configuring simple topology using Network tool - CISCO PACKET TRACER.

AIM: To build and configure VLAN (Virtual LAN) using CISCO Packet Tracer.

Packet Tracer is a network simulation program that allows students to experiment with network behaviour and ask “what if” questions. Packet Tracer provides simulation, visualization, and authoring, assessment, and collaboration capabilities and facilitates the teaching and learning of complex technology concepts.

Expected Outcome of Experiment:

CO1: Explain the fundamentals of the data communication networks, reference models, topologies, physical media, devices, simulators and identify their use in day-to-day networks.

CO3: Demonstrate various network layer protocols and network design using IP addressing concepts.

Pre-Lab/ Prior Concepts: Virtual LAN Network flow

A virtual local area network (VLAN) is a LAN which is not configured by physical wiring but it is configured by software. A VLAN is logical group of network devices that appear to be on same LAN despite their geographical distribution. A VLAN is implemented so

that network administrators can connect a group of host in the same domain inspite of their physical location to achieve scalability and improve security features.

To subdivide a network into virtual LANs, one configures a network switch or router. Simpler network devices can partition only per physical port (if at all) , in which case each VLAN is connected with a dedicated network cable (and VLAN connectivity is limited by the number of hardware ports available) More sophisticated devices can mark packets through tagging, so that a single interconnect (trunk) may be used to transport data for multiple VLANs. VLAN can greatly simplify network design and deployment, because VLAN membership can be configured through software.

New Concepts to be learned: Purpose of this lab is to become familiar with building Virtual Network in Packet Tracer.

Stepwise-Procedure:

A. Creating a simple LAN network using packet tracer:

Step 1: Select 12 PCs from the end devices and one fast ethernet switch (2950/24 ports)

Step 2: Connect PCs and switch via copper cable from the panel. Connection can be verified by appearance of all green dots on the links.

Step 3: For PCs to communicate click on PC0.

- Dialog box for PC0 appears
- Click on desktop applications by packet tracer.
- Go to IP configuration.
- Enter IP address to identify host i.e. PC0 (for example: 192.168.1.1)
- Subnet mask-by default already set one can change it as per his/her specification.

Step 4: Repeat step 3 for PC1

Step 5: Ping the PCs and check their working status.

Step 6: Simple PDU (Protocol Data Unit) to simulate network traffic by sending ICMP PDU to assess the network traffic. View simulation in simulation mode

Step 7: . Configure two VLAN in a switch in 6 verticals.

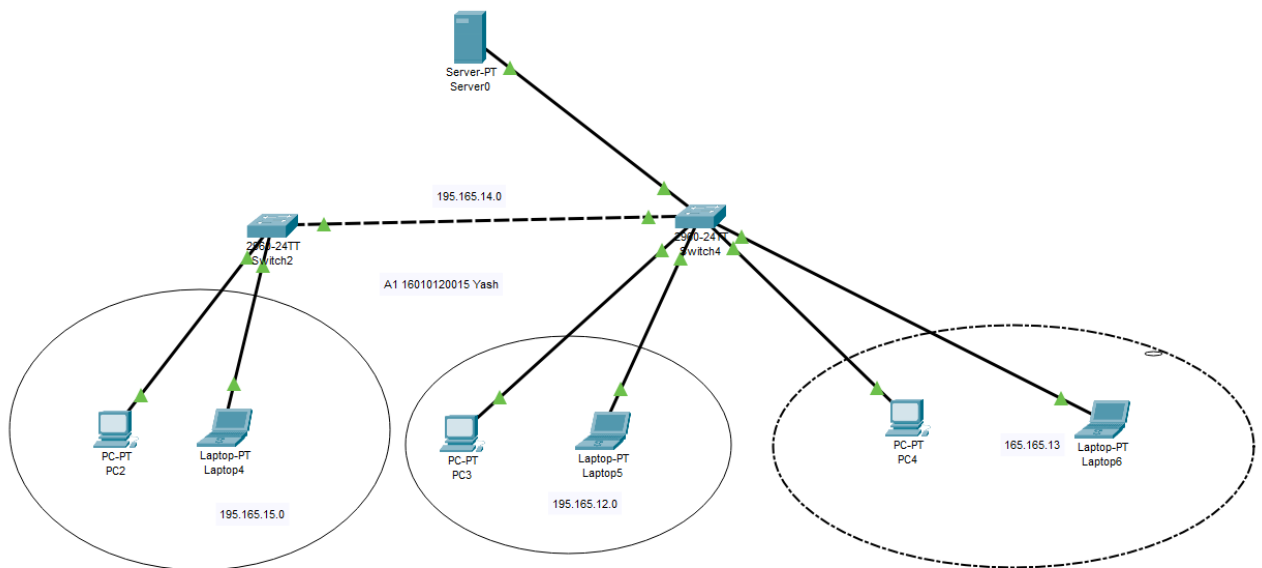

Step 8. As per design, assign membership of VLAN to port using following command
switch port access vlan2 or vlan3

Step 9. Check status of VLAN.

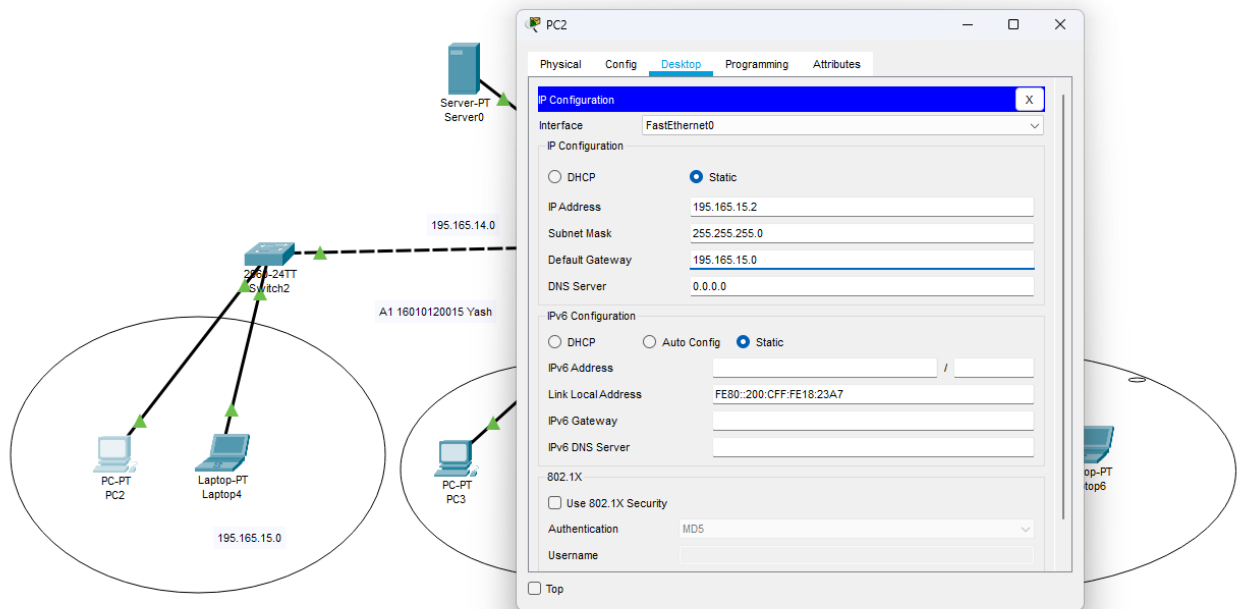

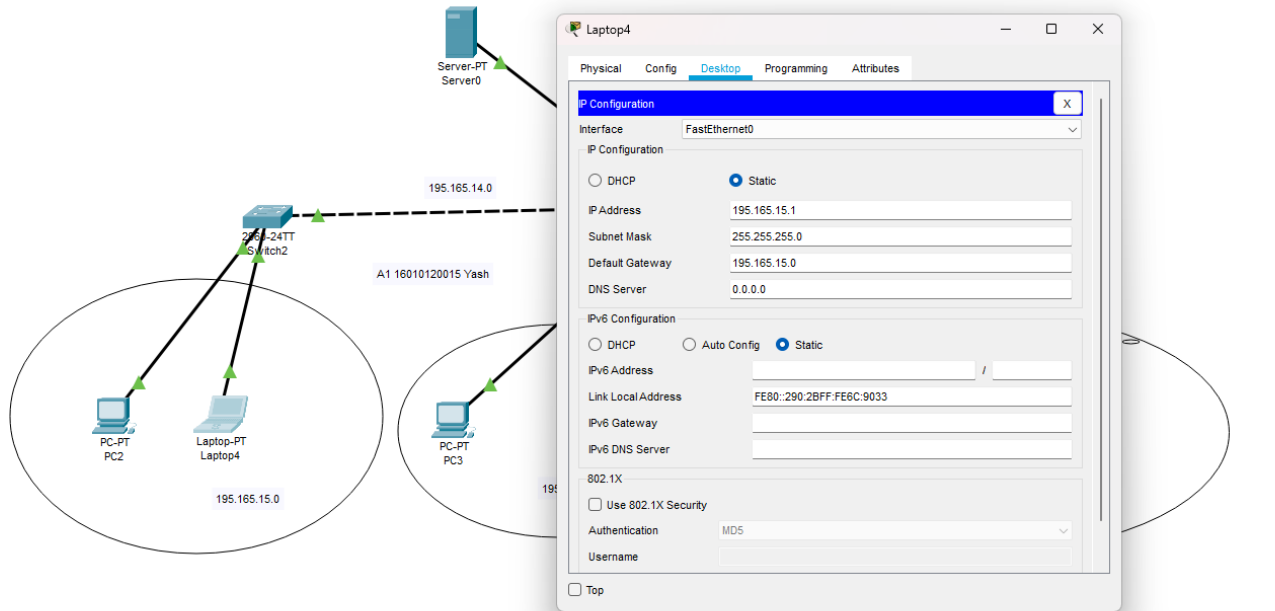

IMPLEMENTATION: (printout of simulation code)

Real Time Simulation :

CONCLUSION:

IN this experiment we understood and implemented to build and configure VLAN (Virtual LAN) using CISCO Packet Tracer

Post Lab Subjective/Objective type Questions:

1. Describe the concept of Virtual LAN.

virtual LAN (VLAN) is a logical overlay network that groups together a subset of devices that share a physical LAN, isolating the traffic for each group.

A LAN is a group of computers or other devices in the same place –

e.g., the same building or campus -- that share the same physical network.

A LAN is usually associated with an Ethernet (Layer 2) broadcast domain, which is the set of network devices an Ethernet broadcast packet can reach.

VLAN is a custom network which is created from one or more local area networks. It enables a group of devices available in multiple networks to be combined into one logical network.

The result becomes a virtual LAN that is administered like a physical LAN. The full form of VLAN is defined as Virtual Local Area Network.

2. Compare LAN with VLAN.

BASIS FOR COMPARISON	LAN	VLAN
Stands for	Local Area Network	Virtual Local Area Network
Devices used	Hub, switch and router.	Switch and bridge.
Broadcast control	Packet is broadcasted to each device.	Sends packet to the specific broadcast domain.
Latency	High	Low
Security	Not secure enough and security measures are only taken at the routers end.	Improves security by limiting the broadcast domain.
Flexibility and scalability	Only filter the frames and is less scalable.	Specifies the port and protocols to identify the frame.
Cost	Higher comparatively.	Less

3. State the benefits of implementing VLAN.

VLANs provide a number of advantages, such as :

Flexibility

In the organization, VLAN acts like the friend who brings people together; it brings administrators and users together.

Security

The major advantage of using a VLAN network is the aspect of security that it provides. The traffic division and segmentation of the traffic restrict unwanted, unknown, and unauthorized users from getting on sensitive networks

Uses

Division of network helps improve security levels, reliability, and efficiency of a network.
